

Technology

Japanese made high ton carbon that is combined with our unique curing process and carbon wrap structure amongst other trade secrets results in super light ,sensitive and responsive blanks, other manufacturers that try to emulate these properties often end up with weaker more brittle rods.

Derived from our surf rod technology, this results in the rods action changing when using a variety of weights, lures etc. causing different parts of the blank to work to suite a required casting weight. Other benefits of this system are more accurate close and long range casting.

All waft blanks are perfectly balanced from the tip to butt section for improved feel, casting distance and accuracy, besides work on the blank itself balancing of component weight, reel seat and guide placing.

Unlike other manufacturers Waft does not reduce blank diameter to reduce weight, which results in compromised action and strength ,Weight kept to a minimum by combining the best quality components and raw materials available amongst other trade secrets .

A unique curing process to retain blank compression in the manufacturing process which benefits in countless advantages, compromising of extended rod life ,action retention over long periods of time ,compressed blank wall thickness boosting overall strength and performance.
